Physical Modeling of Data Warehouses using UML

Contents

- **Motivation**
- UML extension mechanisms
- DW design framework
- DW physical design
- Conclusions and future work

Motivation

- Data warehouses are complex information systems
- Support:
 - OLAP
 - Data mining
 - Decision Support Systems
 - ...
- Building a DW: time consuming, expensive and prone to fail

Motivation

- Partial approaches:
 - ETL processes
 - Logical and conceptual design of the DW based on the MD paradigm
 - Derive DW schema from ER schemas of the data sources
 - ...
- Most of the research efforts focused on MD data models

Motivation

- Implementation decisions:
 - Storage in different disks
 - Replication
 - Vertical and horizontal partitioning
 - Influence performance and maintenance
 - ...
- Solution:
 - Tackle **physical design** from early stages
 - Allows the designer to anticipate physical design decisions
 - Reduce development time and cost

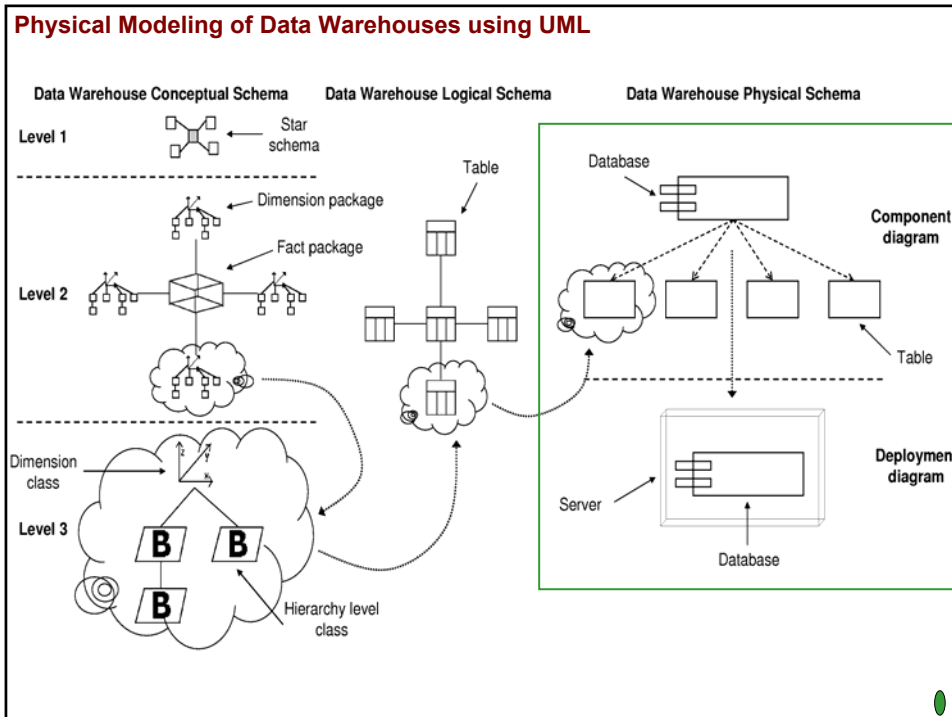

Motivation

- Previous work: **Data Warehouse Engineering Process**
 - Modeling language that assists an entire DW project
 - Based on standards (UML, UP, XML)
 - Represent the models at different levels of granularity (from high-level to low-level)
 - Used at different stages of the DW project
 - Used by different personal (business users, administrators, etc.)

Physical Modeling of Data Warehouses using UML

Motivation

- This work: **Physical Design of DW**
 - Component and deployment diagram from UML
 - Integrated in our DWEP: maps elements from the logical level into the physical level
 - Aimed to be used by DW designers (how to build) and administrators (how to implement and maintain)

Contents

- Motivation
- **UML extension mechanisms**
- DW design framework
- DW physical design
- Applying modeling schemas
- Conclusions and future work

UML extension mechanisms

- UML is a **general purpose** visual modeling language for systems
- Extension mechanisms allow the user to tailor it to specific domains
- Mechanisms:
 - Stereotypes → New building elements
 - Tagged values → New properties
 - Constraints → New semantics

DW diagrams

- Development of DW can be structured into an integrated framework:
 - Five stages
 - Three levels } **Fifteen diagrams**
- Diagrams spread throughout the five stages and the three levels
- Each diagram uses different formalisms (class diagram, component diagram, etc.) → Several UML profiles have been proposed:
 - Multidimensional profile
 - ETL Profile
 - Data Mapping Profile
 - **Database Deployment Profile**

DW diagrams

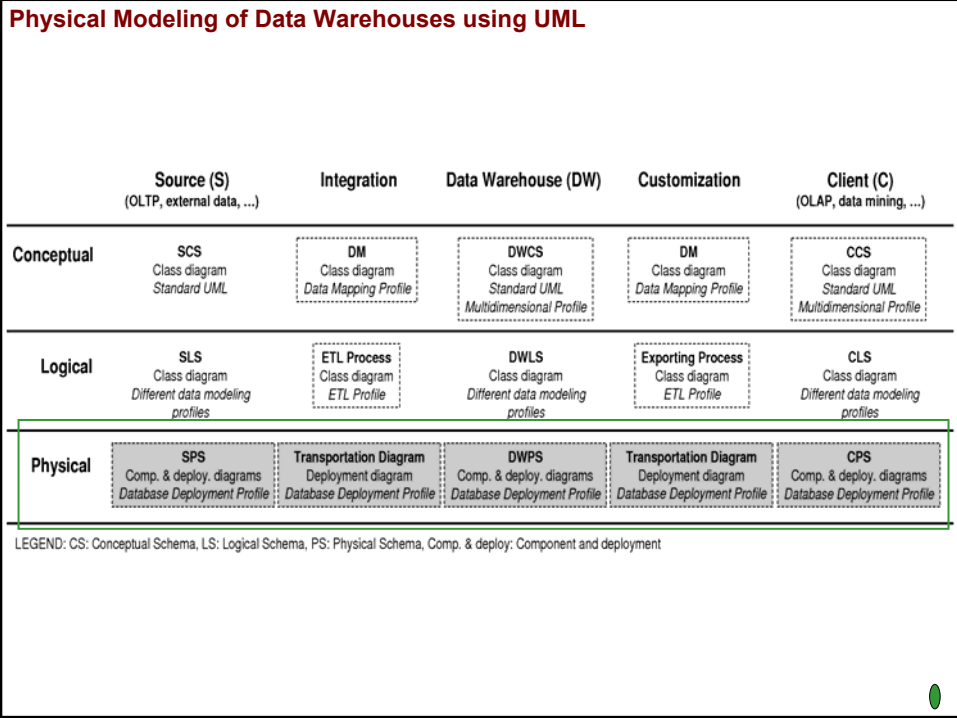

- Stages:
 - Source: data sources (OLTP, external data sources, etc.)
 - Integration: mapping between source and data warehouse
 - Data Warehouse: structure of the DW
 - Customization: mapping between data warehouse and clients' structures
 - Client: structures used by the clients to access the DW (data marts, OLAP applications, etc.)

DW diagrams

- For each stage, different levels:
 - Conceptual
 - Logical
 - Physical
- Remarks:
 - Every DW project does not need the fifteen diagrams
 - The different diagrams of the same DW are not independent but overlapping (UML importing mechanism)

DW physical design

- Example:
 - DW with daily sales of a company that sales automobiles (cars and trucks)
 - Dimensions of analysis: automobile, customer, dealership, salesman, time
 - Two data sources:
 - Sales server: transactions and sales
 - CRM server: customers
 - Different final users' requirements:
 - MacOS and Windows
 - Web and desktop application

 - Traces a project from the conceptual to the physical level
 - Reduces development cost thanks to tackle implementation issues in early stages
 - Different levels of abstraction

Future work

- Index representation
- Formal definition with OCL
- Design guidelines
